Manuscript Preparation

Cheryl Iverson

Print Publication Year: 2007 Published Online: 2009
ISBN: 9780195176339 eISBN: 9780195382846
Item type: chapter
Publisher: Oxford University Press
DOI: 10.1093/jama/9780195176339.003.0002

Preparation of a scholarly manuscript requires thoughtful consideration of the topic and anticipation of the reader's needs and questions. Certain elements either are standard parts of all manuscripts or are used so often as to merit special instruction. These elements are discussed in this section in the order in which they appear in the manuscript. References are discussed separately in chapter 3 and tables and figures in chapter 4. The preparation of any manuscript for publication should take the requirements of the intended journal into account; this may enhance the chances of acceptance and expedite publication. For the author, manuscript preparation requires familiarity with the journal to which the article is submitted. Most journals publish instructions for authors, which serve as useful guides; some journals' instructions for authors contain a manuscript checklist (see that from JAMA 1 [reproduced in this chapter as the Table] as an example)...

Titles and Subtitles

Cheryl Iverson

Print Publication Year: 2007 Published Online: 2009
ISBN: eISBN:
Item type: section
Publisher: Oxford University Press
DOI: 10.1093/jama/9780195176339.021.24

Titles should be concise, specific, and informative and should contain the key points of the work. For scientific manuscripts, overly general titles are not desirable (but see also , Names of Cities, Counties, States, Provinces, and Countries).(Note: The shorter, more general title might be appropriate for an editorial or an opinion piece.)Similarly, although the subtitle is frequently useful in expanding on the title, it should not contain key elements of the study as a supplement to an overly general title.However, too much detail also should be avoided. Subtitles should complement the title by providing supplementary information that will supply more

Bylines and End-of-Text Signatures

Cheryl Iverson

Print Publication Year: 2007 Published Online: 2009

Item type: section

In major articles, authors are listed in a byline, which appears immediately below the title or subtitle. In letters, editorials, book reviews, essays, poems, and news stories, the authors' names may appear as signatures at the end of the text, rather than as a byline under the title. The authors' names and academic degrees are used, as in the byline. Further information given in the signature varies with the journal. The author should consult a recent issue for style and format.The byline or signature block should contain each author's full name (unless initials are preferred to full names), including, for

Footnotes to Title Page

Cheryl Iverson

Print Publication Year: 2007 Published Online: 2009

Item type: section

Footnotes should be avoided within the text. Such explanatory material can usually be incorporated into the text parenthetically. The footnotes discussed below are those that may appear at the bottom of the first page of major articles.The preferred order of the footnotes at the bottom of the first page of an article in JAMA and the Archives Journals is as follows (see also , Typography). Note: Not all articles will include all of these. # Author affiliations# Death of an author (death dagger [†]) (see , Footnotes to Title Page, Death)# Information about members of a group (see , Acknowledgment

Running Foot

Cheryl Iverson

Item type: section

Printed pages customarily carry the journal name or abbreviation, volume number, date of issue, and page number. They may also include a shortened version of the article title. When this information appears at the top of the page, it is called a running head; when it appears at the bottom of the page, it is called a running foot. These are typically added during the editing and production process, and authors are not usually required to submit such information. (See also , Typography.)Use the accepted List of Journals Indexed for MEDLINE abbreviations of journal names (see , Abbreviations, Names of

Abstract

In this age of electronic data dissemination and retrieval, in which abstracts are typically indexed and freely available, a well-written abstract has become increasingly important in directing readers to articles of potential clinical and research interest. The abstract of a research report summarizes the main points of an article: (1) the study objective or background, (2) the study design and methods, (3) primary results, and (4) principal conclusions. For scientific studies and systematic reviews, narrative expressions, such as "X is described," "Y is discussed," "Z is also reviewed," do not add meaning and should be avoided. Results should be presented

Keywords

Item type: section
Publisher: Oxford University Press
DOI: 10.1093/jama/9780195176339.021.29

Some medical journals publish a short list (3 10) of keywords at the end of the abstract. These descriptors are provided by the author and are the terms the author believes represent the key topics presented in the article. These may also be used for some journals to categorize manuscripts, to help guide in the selection of peer reviewers, and to assist the journal's indexer. JAMA and the Archives Journals do not publish keywords. Articles in JAMA and the Archives Journals are indexed by professional indexers by means of, for example, Medical Subject Headings (MeSH) for indexes such as List

Epigraphs

Cheryl Iverson

Print Publication Year: 2007 Published Online: 2009
ISBN: eISBN:
Item type: section
Publisher: Oxford University Press
DOI: 10.1093/jama/9780195176339.021.30

Epigraphs are rarely used for research papers. On occasion an author will use an epigraph, a short quotation set at the beginning of a nonresearch article, to suggest the theme of the article. In JAMA and the Archives Journals, epigraphs are set in italics, beginning flush left, with the signature set in roman type underneath the quotation, flush right with the longest line of the quotation. If the work cited appears in the reference list, a superscript number should indicate the source. Otherwise, the title of the work should be indicated.The medical profession seems to have no place for itsmistakes.… And

Parts of a Manuscript, Headings, Subheadings, and Side Headings

UPDATE: We will discontinue using quotation marks to identify parts of an article, but retain the capitalization; eg, This is discussed in the Methods section (not the “Methods” section). This change was made February 14, 2013.UPDATE: To return to the conventional IMRAD nomenclature, the JAMA Network journals are implementing Discussion rather than Comment as the summary section heading in all article types. This will also alleviate any confusion between the online functionality of leaving comments on an article and the use of Comment as a section heading. This change was implemented April 1, 2013.A consistent pattern of organization for all

Addenda

Cheryl Iverson

Print Publication Year: 2007 Published Online: 2009
ISBN: eISBN:
Item type: section
Publisher: Oxford University Press
DOI: 10.1093/jama/9780195176339.021.32

Addenda may be material added to an article late in the publication process or may be material that is considered supplementary to the article. (Note: This is distinct from supplementary Web-only material, although addenda may sometimes be presented as supplementary Web-only material. For that, see , Online-Only [Supplementary] Material.) The use of addenda is discouraged in JAMA and the Archives Journals. If material is added late in the publication process, well after a manuscript has been accepted for publication (eg, the addition of another case report, extended follow-up, data or information on recent legislation or other relevant event, or additional
